## Review by a Real User

Verified by IT Central Station

Clinical Applications Systems Analyst - HIM/Profile, EHR Alliance at a healthcare company with 1,001-5,000 employees

**it\_user300609**

### **VALUABLE FEATURES:**

The ease of automating and scheduling work processes to eliminate manual tasks.

You can group jobs by functional area (Lab and RAD), or by similar output, and results such as scheduling reports for departments. Visual display of successful jobs and failures is easy to see at a glance. You can also automate error reports and email them to your support team.

By grouping jobs into categories such as Lab or RAD, when an end user calls with an issue, it makes it easier to troubleshoot. You can go directly to that functional group and look for failures.

### **IMPROVEMENTS TO MY ORGANIZATION:**

It reduces the need to manually enter jobs, which enables the analyst to focus on other tasks than are more important or which do not have the ability to be automated.

### **USE OF SOLUTION:**

I've been using it for over 10 years.

### **CUSTOMER SERVICE:**

Excellent customer support from Cerner.

**OTHER ADVICE:**

I've never installed Opsview Monitor or Scheduler. I believe these are standard applications that come with implementing Cerner Millennium. Many companies reserve these applications for system administrators as they are normally at a higher technical level of understanding and implementing. These tools are great for monitoring and adding new jobs by an applications analyst.
